## Executive Summary

The Alberta Energy Regulator (AER) annually publishes *ST60B: Upstream Petroleum Industry Flaring and Venting Report* to fulfil the commitment it made in *Directive 060: Upstream Petroleum Industry Flaring, Incinerating, and Venting* to make flaring and venting data accessible.

The report's primary focus is on solution gas flaring and venting from crude oil and crude bitumen production operations. The report includes flared and vented volumes from in situ bitumen facilities, gas batteries, well testing, gas plants, gas gathering systems, and natural gas transmission lines. Also included are emission statistics from glycol dehydrators, surface casing vent flow (SCVF), and gas migration (GM). The report does not include flared and vented volumes from bitumen upgraders and oil sands mine operations. The data used to compile the report are obtained from Canada's Petroleum Information Network (Petrinex) and the AER. The AER recognizes that there are currently emissions in the upstream petroleum industry that are not required to be reported to the AER and thus are not included in *ST60B*.

Key statistics from 2015 include the following (some totals may not sum exactly due to rounding):

- Crude bitumen production increased by 7.2 per cent to 80 million cubic metres ( $10^6 \text{ m}^3$ ).
- Crude oil production decreased by 9.9 per cent to  $30 10^6 \text{ m}^3$ .
- Solution gas produced from crude bitumen batteries increased by 8.3 per cent to  $2644 10^6 \text{ m}^3$ .
- Solution gas produced from crude oil batteries increased by 0.9 per cent to  $18 535 10^6 \text{ m}^3$ .
- Solution gas conservation increased to 96.4 per cent from 95.6 per cent in 2014.
- Solution gas flared from crude bitumen and crude oil batteries was  $419 10^6 \text{ m}^3$ , down from  $490 10^6 \text{ m}^3$  in 2014, a 14.5 per cent decrease.
  - Total solution gas flared represented 1.5 million tonnes of carbon dioxide equivalent ( $10^6 \text{ tCO}_2\text{e}$ ) of greenhouse gas (GHG) emissions.
  - Flaring from crude bitumen batteries was  $99 10^6 \text{ m}^3$ , up from  $87 10^6 \text{ m}^3$  in 2014, a 13.6 per cent increase.
  - Flaring from crude oil batteries was  $320 10^6 \text{ m}^3$ , down from  $403 10^6 \text{ m}^3$  in 2014, a 20.6 per cent decrease.
- Solution gas vented from crude bitumen and crude oil batteries was  $354 10^6 \text{ m}^3$ , down from  $429 10^6 \text{ m}^3$  in 2014, a 17.6 per cent decrease.
  - Total solution gas vented represented  $6.0 10^6 \text{ tCO}_2\text{e}$  of GHG emissions.
  - Venting from crude bitumen batteries was  $187 10^6 \text{ m}^3$ , down from  $254 10^6 \text{ m}^3$  in 2014, a 26.3 per cent decrease.
  - Venting from crude oil batteries was  $166 10^6 \text{ m}^3$ , down from  $175 10^6 \text{ m}^3$  in 2014, a 4.9 per cent decrease.

- Flaring and venting from other sources:
  - Gas batteries
    - Flaring –  $82 \text{ } 10^6 \text{ m}^3$ , down from  $100 \text{ } 10^6 \text{ m}^3$  in 2014, an 18.4 per cent decrease
    - Venting –  $18 \text{ } 10^6 \text{ m}^3$ , down from  $30 \text{ } 10^6 \text{ m}^3$  in 2014, a 40.8 per cent decrease
  - Well testing
    - Flaring –  $152 \text{ } 10^6 \text{ m}^3$ , down from  $238 \text{ } 10^6 \text{ m}^3$  in 2014, a 36.2 per cent decrease
    - Venting –  $22 \text{ } 10^6 \text{ m}^3$ , down from  $24 \text{ } 10^6 \text{ m}^3$  in 2014, a 7.8 per cent decrease
  - Gas plants
    - Flaring –  $151 \text{ } 10^6 \text{ m}^3$ , up from  $148 \text{ } 10^6 \text{ m}^3$  in 2014, a 2.5 per cent increase
    - Venting –  $3 \text{ } 10^6 \text{ m}^3$ , the same as in 2014
  - Gas gathering systems
    - Flaring –  $62 \text{ } 10^6 \text{ m}^3$ , down from  $64 \text{ } 10^6 \text{ m}^3$  in 2014, a 2.2 per cent decrease
    - Venting –  $9 \text{ } 10^6 \text{ m}^3$ , up from  $7 \text{ } 10^6 \text{ m}^3$  in 2014, a 37.5 per cent increase
  - Transmission lines
    - Flaring –  $4 \text{ } 10^6 \text{ m}^3$ , up from  $1 \text{ } 10^6 \text{ m}^3$  in 2014, a 602.3 per cent increase
    - Venting –  $8 \text{ } 10^6 \text{ m}^3$ , down from  $13 \text{ } 10^6 \text{ m}^3$  in 2014, a 33.8 per cent decrease
- Emissions from glycol dehydrators
  - 1778 glycol dehydrators emitted 609 tonnes of benzene after controls in 2015 compared with 1886 glycol dehydrators and 746 tonnes of benzene emissions after controls in 2014
- Emissions from SCVF and GM
  - 10 247 SCVF and GM wells emitted  $86 \text{ } 10^6 \text{ m}^3$  of natural gas in 2015 compared with 9982 SCVF and GM wells and  $84 \text{ } 10^6 \text{ m}^3$  of natural gas in 2014

## 1 Introduction

The Alberta Energy Regulator (AER) is the province's single energy regulator whose core functions include conserving Alberta's energy resource, protecting public safety and the environment, and disseminating energy-related information. The AER's activities on reducing flaring and venting, including its partnership work, address conservation, public safety, and information dissemination.

The AER worked with the consensus-based, multistakeholder Flaring and Venting Project Team of the Clean Air Strategic Alliance (CASA) to develop flaring and venting management recommendations for the Province of Alberta. The recommendations included determining flaring and venting baselines, flaring reduction targets, and operational requirements for the upstream oil and gas industry. The AER adopted the recommendations put forward by CASA and incorporated them into the 1999 edition of *Guide 60: Upstream Petroleum Industry Flaring Guide* (subsequently known as *Directive 060: Upstream Petroleum Industry Flaring, Incinerating, and Venting*). The AER will continue to work with CASA, industry, and other stakeholders to reduce the volume of solution gas flared and vented in Alberta.

*ST60B: Upstream Petroleum Industry Flaring and Venting Report*, published annually, fulfils the AER's commitment to report flaring and venting volumes, as set out in *Directive 060*.

The report's primary focus is on solution gas flaring and venting from crude oil and crude bitumen production operations. The report includes flared and vented volumes from in situ bitumen facilities, gas batteries, well testing, gas plants, gas gathering systems, and natural gas transmission lines. Also included are emission statistics from glycol dehydrators, surface casing vent flow (SCVF), and gas migration (GM). The report does not include flared and vented volumes from bitumen upgraders and oil sands mine operations. The data used to compile the report are obtained from Canada's Petroleum Information Network (Petrinex) and the AER. The AER recognizes that there are currently emissions in the upstream petroleum industry that are not required to be reported to the AER and thus are not included in *ST60B*.

For this report,

- crude bitumen is oil that is produced within the AER-designated oil sands areas<sup>1</sup> and that has a density of 920 kilograms per cubic metre ( $\text{kg}/\text{m}^3$ ) or more;
- crude oil is all other crude oil production in the province, including oil with a density of  $920 \text{ kg}/\text{m}^3$  or more produced outside the designated oil sands areas;
- all reported flared volumes include gas that was incinerated, unless otherwise stated;
- venting is defined as the noncombusted release of gas to the atmosphere;
- gas conservation is calculated as

$$\text{conservation} = \frac{[\text{Volume of gas produced} - (\text{Volume of gas flared} + \text{volume of gas vented})]}{\text{Volume of gas produced}}, \text{ and}$$

---

<sup>1</sup> See ST98-2016: Alberta's Energy Reserves 2015 and Supply/Demand Outlook, figure R3.1, available on the AER website, [www.aer.ca](http://www.aer.ca).

- greenhouse gas (GHG) emissions are expressed in tonnes of carbon dioxide equivalent (tCO<sub>2</sub>e).<sup>2</sup> The GHG emission factors for flared and vented gas vary depending on the type of production as follows:
  - Crude oil<sup>3</sup>
    - Vented gas GHG emission factor = 16.8 tCO<sub>2</sub>e per thousand cubic metres ( $10^3$  m<sup>3</sup>) of gas
    - Flared gas<sup>4</sup> GHG emission factor = 3.9 tCO<sub>2</sub>e per  $10^3$  m<sup>3</sup> of gas
  - Crude bitumen within the Peace River area<sup>5,6</sup>
    - Vented gas GHG emission factor = 17.6 tCO<sub>2</sub>e per  $10^3$  m<sup>3</sup> of gas
    - Flared gas GHG emission factor = 2.8 tCO<sub>2</sub>e per  $10^3$  m<sup>3</sup> of gas
  - Crude bitumen outside the Peace River area<sup>7</sup>
    - Vented gas GHG emission factor = 17.0 tCO<sub>2</sub>e per  $10^3$  m<sup>3</sup> of gas
    - Flared gas GHG emission factor = 2.7 tCO<sub>2</sub>e per  $10^3$  m<sup>3</sup> of gas

For information on flaring, incinerating, and venting requirements, see *Directive 060*. For questions about this report, email the AER Environment and Operational Performance Branch, Resource Compliance Team, at [ResourceCompliance@aer.ca](mailto:ResourceCompliance@aer.ca) or call the Customer Contact Centre at 403-297-8311 or toll free at 1-855-297-8311.

## **2 Solution Gas Conserved, Flared, and Vented, 1996–2015**

Gas conservation is the recovery of solution gas to use as fuel for production facilities, to sell, to inject for enhanced recovery from oil or condensate pools, or to generate power, among other uses. Industry achieved a 96.4 per cent solution gas conservation rate in 2015, compared with 95.6 per cent in 2014 (see figure 1). Data from all crude oil and crude bitumen batteries were used in calculating the percentage of solution gas conserved.

The combined volume of flared and vented solution gas decreased 22.1 per cent to 773 million cubic metres ( $10^6$  m<sup>3</sup>) in 2015 from 920  $10^6$  m<sup>3</sup> in 2014.<sup>8</sup> The total volume of gas flared and vented at crude oil and crude bitumen batteries represented 7.5 million tonnes of carbon dioxide equivalent ( $10^6$  tCO<sub>2</sub>e) of GHG emissions.

---

<sup>2</sup> Methane, which is a major component in venting, has 25 times more global warming potential than carbon dioxide.

<sup>3</sup> Solution gas from crude oil production is assumed to have a methane content of 53 per cent.

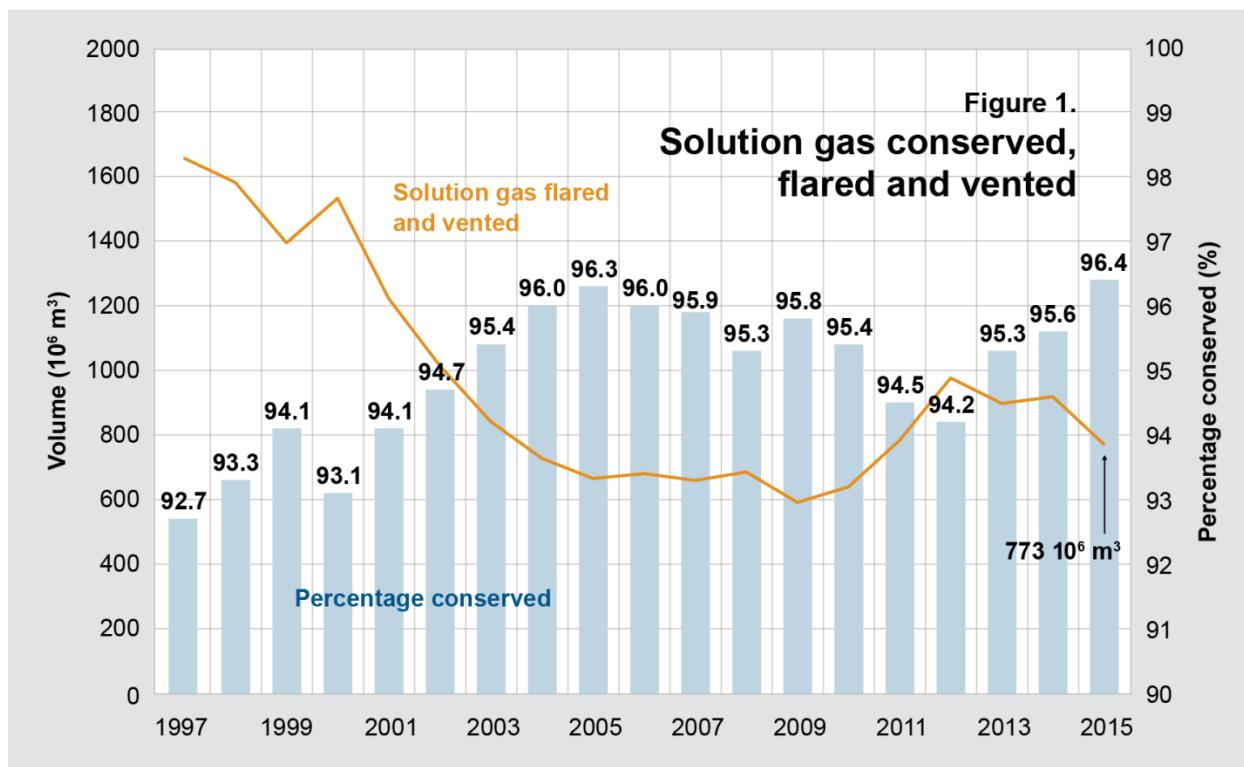

<sup>4</sup> Flaring is assumed to have a 95 per cent conversion efficiency.

<sup>5</sup> See *Directive 060: Upstream Petroleum Industry Flaring, Incinerating, and Venting*, figure 10, available on the AER website, [www.aer.ca](http://www.aer.ca).

<sup>6</sup> Solution gas from crude bitumen production within the Peace River area is assumed to have a methane content of 89 per cent.

<sup>7</sup> Solution gas from crude bitumen production outside the Peace River area is assumed to have a methane content of 94 per cent.

<sup>8</sup> Values in this report have been rounded to the nearest  $10^6$  m<sup>3</sup>.

### 3 Solution Gas Flaring and Venting Performance

In 2015,  $419 \text{ } 10^6 \text{ m}^3$  of gas was flared, which represented  $1.5 \text{ } 10^6 \text{ tCO}_2\text{e}$  of GHG emissions, and  $354 \text{ } 10^6 \text{ m}^3$  was vented, which represented  $6.0 \text{ } 10^6 \text{ tCO}_2\text{e}$  of GHG emissions. The flared volumes were 68.7 per cent less than the 1996 flaring baseline of  $1340 \text{ } 10^6 \text{ m}^3$  and were 14.5 per cent less than 2014 volumes (see figure 2). Flaring was also below the annual flaring limit of  $670 \text{ } 10^6 \text{ m}^3$ . The vented volumes were 49.8 per cent less than the 2000 venting baseline of  $704 \text{ } 10^6 \text{ m}^3$  and 17.6 per cent less than the 2014 volumes (see figure 3).

The years 1996 and 2000 were selected as the baseline years for solution gas flaring and venting, respectively, since data from these years were the most recent available to the CASA Flaring and Venting Project Team.

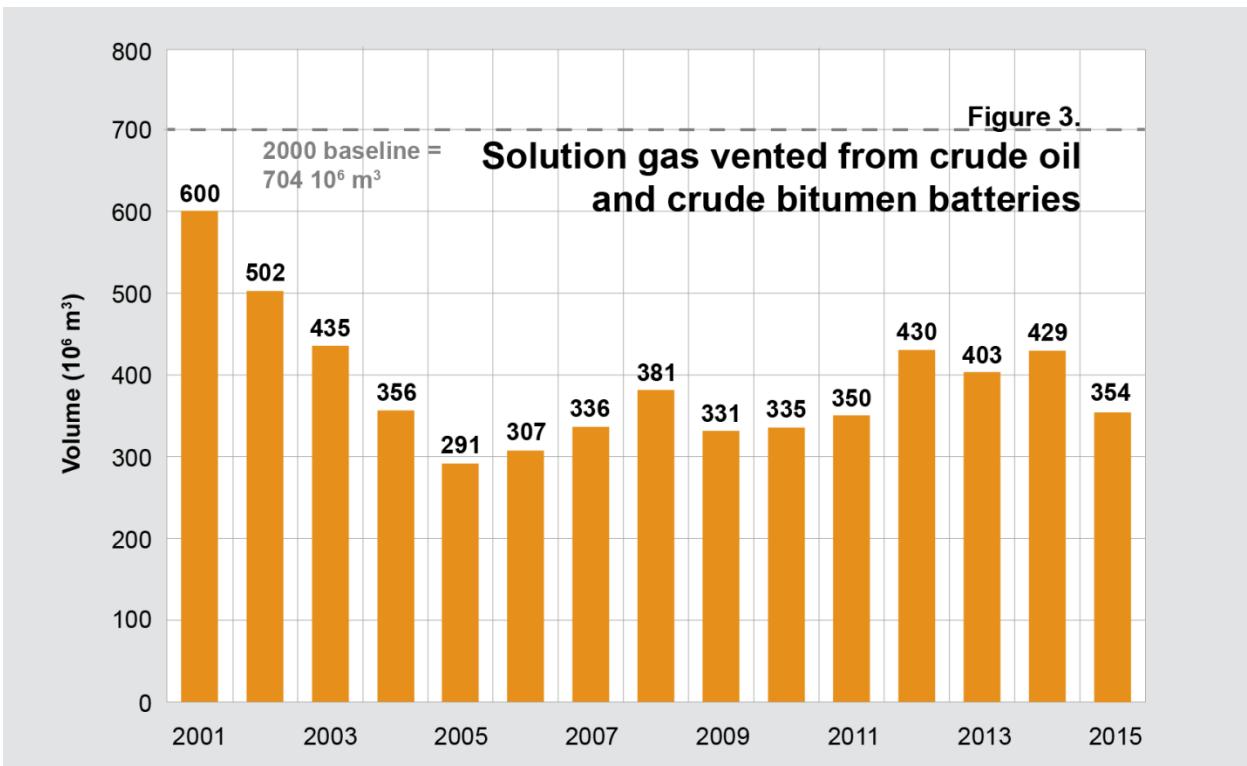

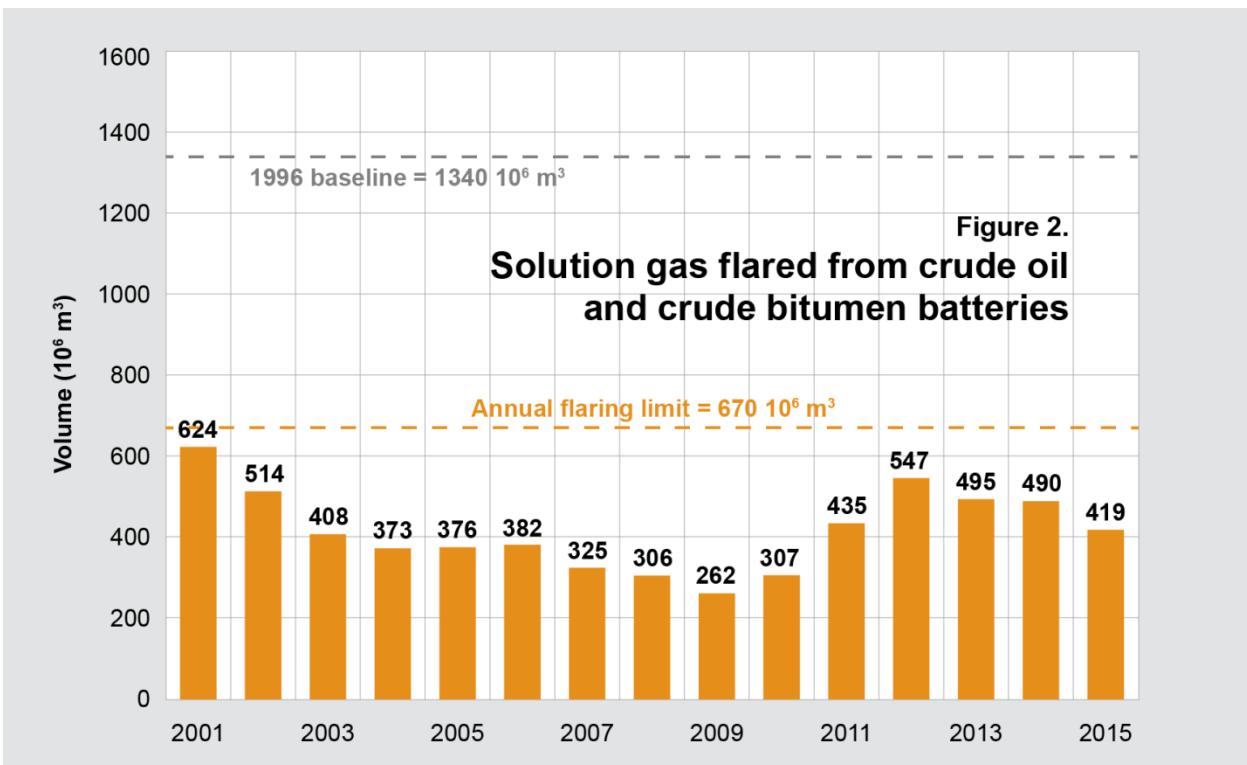

Table 1 shows the statistics for oil and bitumen production and solution gas flaring, venting, production, and conservation for crude oil and crude bitumen batteries, comparing 2015 to 2014. Crude oil production decreased and crude bitumen production increased in 2015. Total solution gas flared and vented decreased despite the increased gas production in 2015. Solution gas conservation increased for both crude oil and crude bitumen production in 2015. For crude bitumen batteries, gas venting decreased while gas flaring increased. This is more desirable from a GHG perspective because flaring has a lower impact than venting.

The table also shows the total number of batteries operating in 2015 and the number of batteries flaring, venting, and with gas conservation. There was an overall decrease in the number of batteries operating in 2015 compared with 2014.

**Table 1. Flaring and venting statistics for crude oil and crude bitumen batteries, 2014–2015**

	2015			2014			2015 vs. 2014 % change		
	Crude bitumen batteries	Crude oil batteries	Crude & crude bitumen batteries	Crude bitumen batteries	Crude oil batteries	Crude & crude bitumen batteries	Crude bitumen batteries	Crude oil batteries	Crude bitumen batteries
Crude oil or bitumen production ( $10^6 \text{ m}^3$ )	80	30	110	74	34	108	7.2	-9.9	2.0
Solution gas flaring ( $10^6 \text{ m}^3$ )	99	320	419	87	403	490	13.6	-20.6	-14.5
Solution gas venting ( $10^6 \text{ m}^3$ )	187	166	353	254	175	429	-26.3	-4.9	-17.6
Solution gas production ( $10^6 \text{ m}^3$ )	2 644	18 535	21 179	2 442	18 365	20 807	8.3	0.9	1.8
Solution gas conservation ( $10^6 \text{ m}^3$ )	89.2%	97.4%	96.4%	86.0%	96.9%	95.6%	3.2	0.5	0.8
Total number of batteries	3 711	10 539	14 250	3 621	11 551	15 172	2.5	-8.8	-6.1
Number of batteries flaring gas <sup>a</sup>	168	1 875	2 043	197	2 424	2 621	-14.7	-22.6	-22.1
Number of batteries venting gas <sup>a</sup>	2 764	5 106	7 870	2 817	5 458	8 275	-1.9	-6.4	-4.9
Number of batteries with gas conservation <sup>b</sup>	1 153	5 029	6 182	1 014	5 304	6 318	13.7	-5.2	-2.2

a. Batteries can report flared gas, vented gas, or both.

b. Batteries with an annual gas conservation of more than 89.99 per cent.

## Discussion

*Directive 060*, starting with the edition that went into effect on January 31, 2007, requires that all solution gas flares or vents releasing more than  $900 \text{ m}^3/\text{day}$  must be economically evaluated to see if gas conservation is viable. If the net present value (NPV) of gas conservation at a crude oil battery is found to be greater than negative \$55 000, the well or battery must not be produced until the gas is conserved. At crude bitumen batteries, as soon as gas flow rates exceed an average of  $900 \text{ m}^3/\text{day}$  for any consecutive

three-month period within a rolling six-month window, operators have up to six months to conserve the solution gas if the NPV of gas conservation is greater than negative \$55 000. Before 2007, *Directive 060* required at least a neutral NPV (i.e., \$0.00) before solution gas conservation was necessary.

Despite the change in the NPV threshold for solution gas conservation, low natural gas prices and higher pipeline and compression capital costs in 2015 continued to challenge the economic viability of conservation.

Crude bitumen batteries accounted for 37.1 per cent of the solution gas flared and vented in 2015, with 65.4 per cent of this volume being vented. Crude bitumen generally has lower gas-to-oil ratios than crude oil, which means that the lower gas rates associated with bitumen makes the solution gas less likely to be combusted.

There are two types of crude bitumen operations: primary and in situ oil sands. Primary oil sands include operations such as cold heavy oil production with sand while in situ oil sands include operations such as thermal production. In situ oil sands operations generally have less flaring and venting because the produced gas is more economic to conserve. Table 2 below shows the statistics for primary operations compared with in situ oil sands operations for 2015.

**Table 2. Flaring and venting statistics for primary and in situ oil sands operations for 2015**

	Primary operations	In situ oil sands operations	Total crude bitumen operations
Solution gas production ( $10^6 \text{ m}^3$ )	1382	1262	2644
Solution gas flaring ( $10^6 \text{ m}^3$ )	83	17	99
Solution gas venting ( $10^6 \text{ m}^3$ )	183	4	187
Crude bitumen production ( $10^6 \text{ m}^3$ )	16	64	80
Solution gas conservation	80.8%	98.3%	89.2%
Number of batteries	3656	55	3711

The AER has taken action to address emissions and odours from heavy oil operations in the Peace River area. In April 2014, the AER accepted an independent panel of hearing commissioners' recommendations that are within the AER's jurisdiction. As a result of these recommendations, requirements have been implemented to effectively eliminate venting and minimize flaring in the area.

The oil and gas industry is constructively using a large portion of produced solution gas from primary crude bitumen operations as fuel to run pump motors and tank heaters. Unfortunately, conserving the remaining small volume of gas is more economically challenging.

#### 4 Flaring from All Upstream Oil and Gas Sources, 2000–2015

The total flared volume from all upstream oil and gas sources in 2015 was  $871 \text{ } 10^6 \text{ m}^3$ , a decrease of 16.3 per cent from 2014 (see figure 4). The data in table 3 were used to prepare figure 4.

**Table 3. Flaring from upstream oil and gas sources ( $10^6 \text{ m}^3$ )<sup>a</sup>**

Year	Crude bitumen batteries	Crude oil batteries	Gas batteries <sup>b,c</sup>	Well testing	Gas plants <sup>d</sup>	Gas gathering systems <sup>d</sup>	Transmission lines <sup>e</sup>	Total flared <sup>a</sup> ( $10^6 \text{ m}^3$ )
2000	76	755	36	335	196	48	-	1446
2001	66	558	41	326	159	50	-	1200
2002	73	441	35	280	127	48	-	1004
2003	36	372	25	284	149	42	-	908
2004	29	343	28	300	153	38	-	891
2005	33	344	27	287	147	31	-	869
2006	39	343	28	301	140	36	-	887
2007	20	305	45	201	124	28	-	723
2008	38	268	34	192	126	32	2	692
2009	54	208	29	106	111	31	2	541
2010	81	226	26	154	114	33	2	636
2011	47	388	33	203	127	32	1	831
2012	54	344	27	287	147	31	-	949
2013	54	344	27	287	147	31	-	918
2014	54	344	27	287	147	31	-	1041
2015	54	344	27	287	147	31	-	871

Year	Crude bitumen batteries	Crude oil batteries	Gas batteries <sup>b,c</sup>	Well testing	Gas plants <sup>d</sup>	Gas gathering systems <sup>d</sup>	Transmission lines <sup>e</sup>	Total flared ( $10^6 \text{ m}^3$ )
2012	70.8	476.7	37.9	189.0	133.6	40.1	1.1	949
2013	66.6	428.6	58.5	198.4	111.1	52.9	2.0	918
2014	87.4	403.0	100.5	237.7	147.8	63.5	0.6	1041
<b>2015</b>	<b>99.3</b>	<b>320.0</b>	<b>82.0</b>	<b>151.7</b>	<b>151.4</b>	<b>62.1</b>	<b>4.2</b>	<b>871</b>
2015 vs change	13.6%	-20.6%	-18.4%	-36.2%	2.5%	-2.2%	602.3%	-16.3%

a. Due to rounding, some totals may not exactly match the sum of the source categories. An additional decimal place has been added to the volumes since 2012 to more accurately reflect the percentage changes.

b. As of ST60B-2015, the category for “CBM & shale gas wells” (CBM = coalbed methane) has been excluded from figure 4 and table 3. The flared volumes from this category have been combined in the “gas batteries” category.

c. The increase seen in the gas battery flaring in 2012 and 2013 relative to previous years’ ST60B is due to corrections made by including flared gas volumes reported at gas wells for gas batteries.

d. The figures for gas plants and gas gathering systems include both flared *and* vented volumes for the years 2000 to 2006.

e. Transmission lines data are submitted to the AER for the purposes of this report voluntarily. The AER does not regulate these lines. Flaring from transmission lines was not tracked in ST60B until 2008.

Table 3 shows an increase in 2015, compared with 2014, in flaring from crude bitumen batteries, gas plants, and transmission lines. There were decreases in flaring from crude oil batteries, gas batteries, well testing, and gas gathering systems in 2015.

## Discussion

In 2015, flared gas volumes from gas batteries was  $82 \text{ } 10^6 \text{ m}^3$ , a decrease of 18.4 per cent from 2014. This was not likely due to changes in gas production because gas production from gas batteries only decreased 1.6 per cent from 2014. Flaring from gas batteries is mainly attributed to horizontal multistage hydraulically fractured gas wells. It takes longer to clean out the wells in these operations to meet pipeline specifications before transmission, so flare volumes are higher and flaring duration is longer. The flared volume during this cleanup period is reported as gas battery flaring and not as well test flaring.

An AER review of 85 well tests showed that 44 per cent of the flared gas was reported incorrectly. The reported flare volumes during well testing may have included some nonhydrocarbon gas, such as carbon dioxide and nitrogen from fracturing operations. In other situations, pipelined gas volumes during well tests (testing in line) were incorrectly reported as flared gas volumes. The AER subtracted these gas volumes from the reported flared volumes to get the actual hydrocarbon gas that was flared during these well tests. This adjustment was only made for the 85 well tests reviewed, and the volumes were not prorated for the entire well test dataset.

In 2015, 1211 well tests were conducted compared with 1691 tests in 2014. There were 1121 well tests conducted that flared or vented compared with 1605 tests in 2014.

When considering all well tests conducted in 2015, the average gas volume flared per test was  $125.2 \text{ } 10^3 \text{ m}^3$ , compared with  $140.6 \text{ } 10^3 \text{ m}^3$  per test in 2014, a decrease of 10.9 per cent (see table 4). This

can be attributed to a decrease of 184 horizontal multistage fractured gas wells tested in 2015. It takes longer to recover load fluids and clean out wells in these operations, resulting in greater flare volumes and longer flaring durations than with vertical wells and wells that are not fractured.

**Table 4. Average volume of gas flared per well test, and number of wells drilled by type**

Year	Volume flared per well test ( $10^3 \text{ m}^3$ )	Number of horizontal multistage fractured oil wells	Number of horizontal multistage fractured oil wells	Total number of wells drilled
2005	34.6	-	-	20 179
2006	40.8	-	-	18 878

*Directive 060* requires that operators seek alternatives to well test flaring. Operators are required to test in line when it is both economically viable and safe to do so. Testing in line can mean either connecting to an existing gas gathering system directly or laying a temporary surface pipeline to connect a well to a remote gas gathering system. By either method, the gas from the well test is conserved.

The data in table 5 represent the flaring from well tests conducted by 25 companies in 2015 and the average volume of gas flared per test. The well tests summarized in the table represent 83.8 per cent of the well tests and 79.4 per cent of the flaring.

**Table 5. Well test flaring, 2015 ranked by number of well tests conducted**

Company	Number of well tests	Gas flared ( $10^6 \text{ m}^3$ )	Average gas flared per test ( $10^3 \text{ m}^3$ )

Of the 1127 gas plants reporting gas receipts in 2015, only 384 gas plants reported flared gas volumes. The total flared gas volume was  $151 \text{ } 10^6 \text{ m}^3$ , which is a 2.5 per cent increase from 2014. All gas plant subtypes contribute to this report, including sweet gas, acid gas flare, acid gas injection, sulphur recovery, straddle, and fractionation. Table 6 shows the top 30 gas plants that flared in 2015, representing 69.3 per cent of flaring from all gas plants. The gas flared as a percentage of gas plant receipts shows the magnitude of the flared gas volumes in relation to the size of the gas plant.

**Table 6. Top 30 flaring gas plants in 2015**

<b>Total</b>			<b>105.0</b>	
<b>% of total gas plant flaring</b>				<b>69.3%</b>

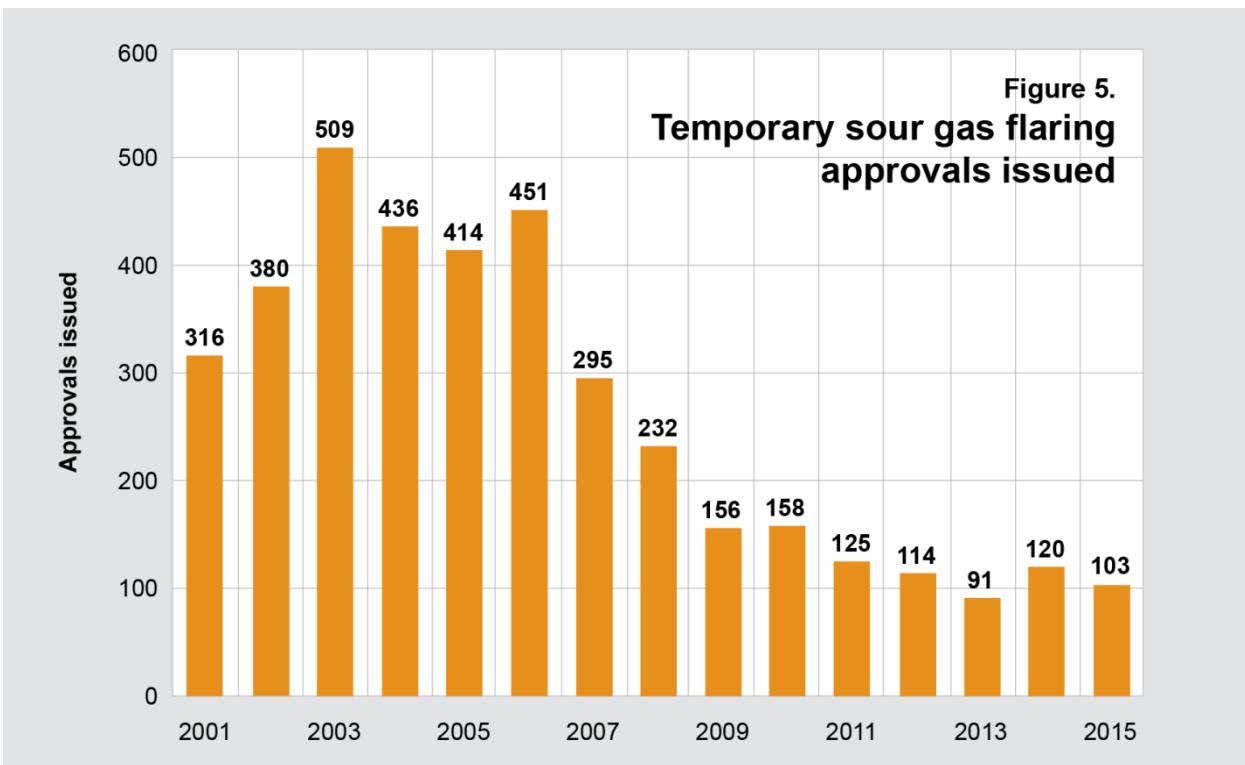

a. This is a fractionation gas plant that reported zero gas receipts.

b. Flaring was due to a downstream outage.

In 2015, 50 per cent of the total volume flared from gas gathering systems came from 5 of the 5563 systems.

In cases of sour gas or sour oil well testing, if the gas to be flared contains more than 5 per cent hydrogen sulphide (H<sub>2</sub>S), a sour gas flaring approval is required. The temporary sour gas approval process involves a detailed review of air quality dispersion modelling and is conducted to ensure that the Alberta Ambient Air Quality Objectives (AAAQO) of Alberta Environment and Parks will not be exceeded. The application for a sour gas flaring approval may also include plans that document how any predicted exceedances of the AAAQO will be mitigated. When the AER is satisfied that the AAAQO will be met, and that levels of all other parameters (such as flared volumes and sulphur emissions) are justified and minimized, a temporary sour gas flaring approval may be issued.

In 2015, the AER issued 103 temporary sour gas flaring approvals, a decrease from the 120 issued in 2014 (see figure 5 below).

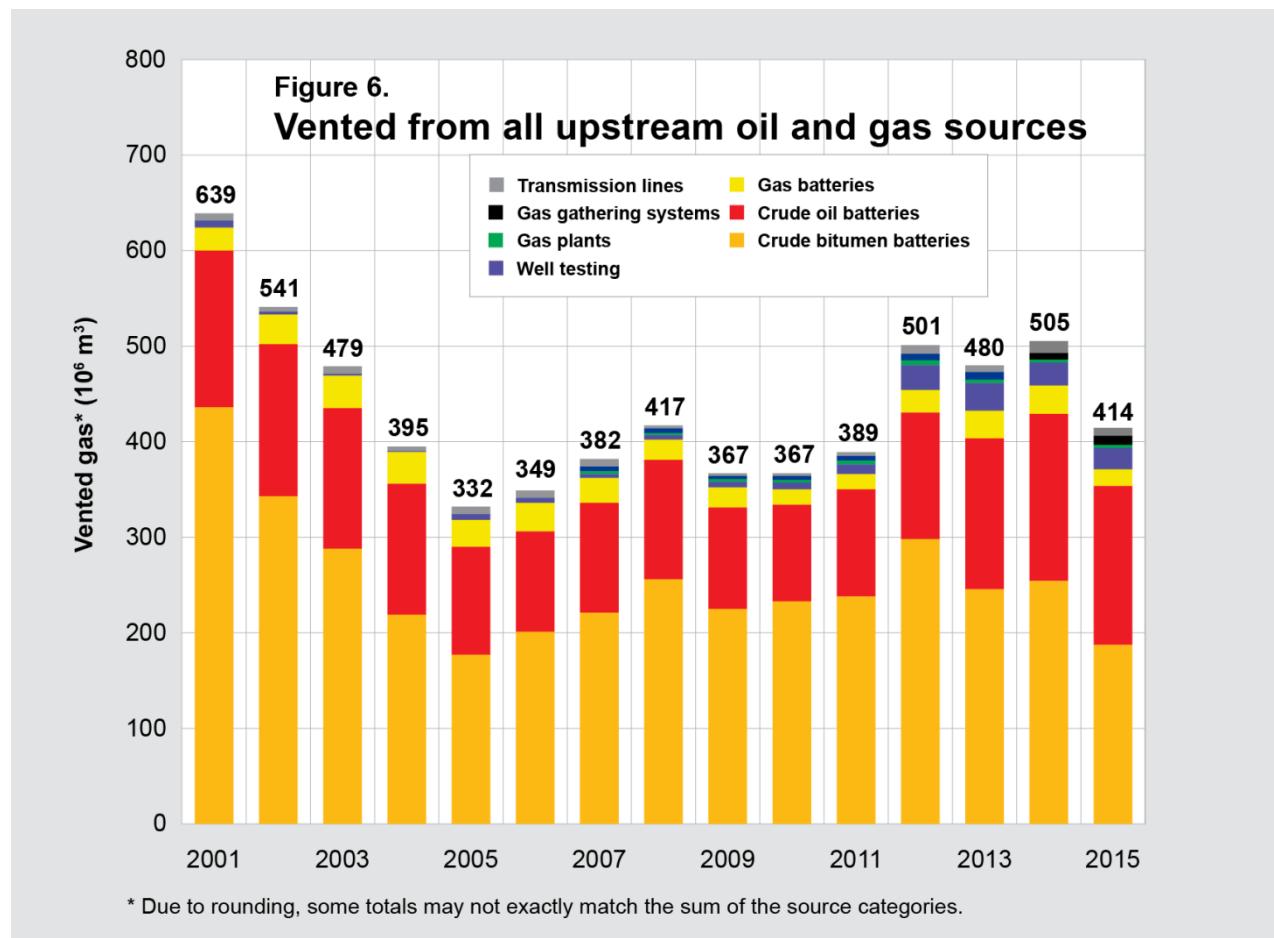

The reason for the decreases in sour gas flaring approvals since 2006 may be twofold. First, market conditions for natural gas have not been as favourable in recent years, which may have resulted in upstream oil and gas licensees rebalancing their capital and operating budgets.

Second, with the release of the revised *Directive 060* at the end of January 2007, a new allowance to flare small volumes of gas containing H<sub>2</sub>S volumes in excess of 5 per cent without a sour gas flaring approval was introduced. With this new allowance, companies are still required to conduct dispersion modelling if the H<sub>2</sub>S concentration of the gas to be flared is in excess of 1 per cent, and proper notification to the AER and public at least 24 hours in advance of flaring operations is still required.

## 5 Venting from All Upstream Oil and Gas Sources, 2000–2015

Figure 6 shows vented volumes broken down by source for 2000 to 2015. The data in table 7 were used to prepare figure 6. As indicated in the table, the total volume vented from all upstream oil and gas sources in 2015 was  $414 \text{ } 10^6 \text{ m}^3$ , a decrease of 18.0 per cent from 2014.

**Table 7. Venting from upstream oil and gas sources ( $10^6 \text{ m}^3$ )<sup>a</sup>**

Year	Crude bitumen batteries	Crude oil batteries	Gas batteries <sup>b</sup>	Well testing	Gas plants	Gas gathering systems	Transmission lines <sup>c</sup>	Total vented ( $10^6 \text{ m}^3$ )
2000	554	150	12	7	0	0	12	735
2001	436	164	24	7	0	0	8	639
2002	343	159	31	3	0	0	5	541
2003	288	147	34	2	0	0	8	479
2004	219	137	33	1	0	0	5	395
2005	177	113	28	6	0	0	8	332
2006	201	105	30	5	0	0	8	349
2007	221	115	26	4	3	5	8	382
2008	256	125	21	5	2	5	3	417
2009	225	106	21	6	3	3	3	367
2010	233	101	16	7	3	4	3	367

Year	Crude bitumen batteries	Crude oil batteries	Gas batteries <sup>b</sup>	Well testing	Gas plants	Gas gathering systems	Transmission lines <sup>c</sup>	Total vented ( $10^6 \text{ m}^3$ )
2011	238	112	16	10	4	5	4	389
2012	298.0	132.4	23.7	26.0	5.1	6.8	9.0	501
2013	245.5	157.9	29.0	28.8	3.7	8.0	7.0	480
2014	254.2	174.8	29.7	24.1	3.1	6.8	12.7	505
<b>2015</b>	<b>187.3</b>	<b>166.2</b>	<b>17.6</b>	<b>22.2</b>	<b>3.4</b>	<b>9.4</b>	<b>8.4</b>	<b>414</b>
2015 vs 2014 change	-26.3%	-5.0%	-40.9%	-8.0%	11.5%	37.0%	-33.6%	-18.0%

a. Due to rounding, some totals may not exactly match the sum of the source categories.

b. As of ST60B-2015, the category for "CBM & shale gas wells" (CBM = coalbed methane) has been excluded from figure 6 and table 7. The vented volumes from this category have been combined in the "gas batteries" category.

c. Transmission lines data are submitted to the AER for the purposes of this report voluntarily. The AER does not regulate these lines.

Table 7 shows a decrease in 2015 compared with 2014 in venting from crude bitumen batteries, crude oil batteries, gas batteries, well testing, and transmission lines. Venting from gas plants and gas gathering systems increased in 2015.

## Discussion

Although the AER does not collect data on greenhouse gas emissions, it is concerned about the impact that these gases can have on the environment. Accordingly, *Directive 060* requires that vented gas that can sustain continuous combustion and that is uneconomic to conserve must be burned.

The most significant source of venting is crude bitumen batteries, where solution gas is vented from the production casing annulus at a large number of individual wells. In some instances, small volumes of solution gas are also vented from treaters and stock tanks at crude oil and crude bitumen batteries.

Venting during well testing is primarily from shallow, sweet, low-deliverability gas wells, including coalbed methane wells.

In *ST60B-2004: Upstream Petroleum Industry Flaring and Venting Report, 2003*, the AER made commitments to identify and set out conservation measures aimed at reducing the volumes of solution gas vented from crude bitumen operations. As a result of industry implementing these measures, there was a net decrease in venting from crude bitumen batteries between 2004 and 2007. However, in 2008 this trend was reversed and there was an increase of 16.9 per cent compared with 2004. This can be mainly attributed to the increase in crude bitumen operations in the province. In 2015, venting from crude bitumen batteries was 14.5 per cent lower than the venting baseline from 2004.

In 2015, venting from crude bitumen batteries decreased by 26.3 per cent to  $187 10^6 \text{ m}^3$  compared with 2014. Crude bitumen production grew by 7.2 per cent to  $80 10^6 \text{ m}^3$  in 2015 compared with 2014, with 90 more crude bitumen batteries operating. Gas conservation from crude bitumen batteries increased to 89.2 per cent in 2015 from 86.0 per cent in 2014.

In 2015, venting from crude oil batteries decreased by 4.9 per cent to  $166 \text{ } 10^6 \text{ m}^3$  compared with 2014. Crude oil production decreased by 9.9 per cent to  $30 \text{ } 10^6 \text{ m}^3$  in 2015 compared with 2014, with 1012 fewer crude oil batteries operating. Gas conservation from crude oil batteries increased to 97.4 per cent in 2015 from 96.9 per cent in 2014.

## 6 Emissions from Glycol Dehydrators

This section of the report summarizes the statistics for benzene emissions from glycol dehydrators (dehydration and refrigeration) regulated by the requirements in *Directive 039: Revised Program to Reduce Benzene Emissions from Glycol Dehydrators*. The AER and Alberta Environment and Parks (AEP) in cooperation with the Canadian Association of Petroleum Producers (CAPP) have established requirements to reduce benzene emissions to ensure that the Alberta Ambient Air Quality Objectives (AAAQO) are not exceeded at public receptor locations, thereby protecting the public and the environment. As outlined in *Directive 039*, licensees must complete and submit to the AER an annual dehydrator inventory list that details the emissions from all glycol dehydrators in the province.

The oil and gas industry has had a benzene reduction program in place since 1997. The program was managed by the Benzene Technical Advisory Team, which has included representatives from AEP, the AER, B.C. Environment, CAPP, Environment Canada, Health Canada, and Saskatchewan Environment. As of 2007, the program is regulated by the AER at upstream oil and gas operations.

In 2015, 1778 glycol dehydrators were processing 153.5 billion cubic metres of gas. Table 8 shows the number of glycol dehydrators, the volume of gas processed, the benzene emissions before and after controls, and the overall control efficiency each year since 2008.

**Table 8. Benzene emissions from glycol dehydrators**

Year	Number of dehydrators <sup>a</sup>	Volume of gas processed ( $10^6 \text{ m}^3$ )	Benzene emissions before controls (tonnes) <sup>b</sup>	Benzene emissions after controls (tonnes) <sup>c</sup>	Overall control efficiency (%) <sup>d</sup>
2008	2396	159 417	3011	1248	58.6
2009	2236	153 323	2750	1093	60.3
2010	2107	134 681	2365	989	58.2
2011	2006	137 790	2286	849	62.9
2012	1985	148 334	2228	794	64.4
2013	1905	142 110	2757	777	71.8
2014	1886	146 036	2640	746	71.7
2015	1778	153 486	2376	609	74.4

a. Only operating dehydrators have been included.

b. Benzene occurs in varying concentrations in natural gas streams throughout the province, and some locations may not have any benzene. All operating dehydrators are included, regardless of the concentration of benzene in the gas stream. Benzene emissions in this report have been rounded to the nearest tonne.

c. Controls are methods for reducing benzene emissions. Examples include condenser systems, incinerators, flare stacks, and burners.

d. The control efficiency is the total benzene emissions before controls minus the total benzene emissions after controls divided by the total benzene emissions before controls. The control efficiencies for individual dehydrators are usually estimates provided by the licensees.

In 2015, there were 609 tonnes of benzene emissions after controls compared to 1248 tonnes in 2008—a 51.2 per cent reduction. This can mainly be attributed to a decrease in the number of glycol dehydrators operating and to the emission reduction requirements specified in *Directive 039*. The overall control efficiency also increased since 2008, indicating that controls were used more often and were more effective at reducing emissions.

Table 9 lists the top 30 companies by the number of glycol dehydrators in 2015. The data in the table represents 72.9 per cent of the total number of operating glycol dehydrators and 70.9 per cent of the benzene emissions after controls.

**Table 9. Top 30 companies listed by the number of glycol dehydrators in 2015**

Company	Number of dehydrators <sup>a</sup>	Benzene emissions before controls (tonnes)	Benzene emissions after controls (tonnes)

<b>Total</b>	<b>1297</b>		<b>432</b>
<b>% of total glycol dehydrators</b>	<b>72.9%</b>		<b>70.9%</b>

a. Only operating dehydrators have been included.

Glycol is the most commonly used desiccant for the dehydration process, but it has a high affinity for water and benzene. Benzene emissions mainly result from the glycol regeneration process, where the water is separated from the glycol through boiling. AER regulations require that benzene emissions are managed to ensure that AAAQO are not exceeded at public receptors.

## 7 Emissions from Surface Casing Vent Flow and Gas Migration

This section of the report summarizes the emission statistics from surface casing vent flow (SCVF) and gas migration (GM). SCVF is the flow of gas or liquid, or both, out of the surface casing or casing annulus of a well; GM is a flow of gas that is detectable at the surface outside of the outermost casing string.

After recognizing an increase in the number of wells with SCVF, in 1995 the AER issued *Interim Directive 95-01: Surface Casing Vent Flow / Gas Migration Requirement*, which specified the categorization of SCVF and GM wells, reporting and monitoring requirements, and a SCVF and GM repair schedule. In 2003, the interim directive was updated and included the reporting of SCVF and GM electronically through the AER's Digital Data Submission system. Over the years, the AER has worked with licensees to ensure proper reporting of SCVF and GM.

Table 10 shows the number of wells with SCVF, GM, or both and the estimated natural gas emissions each year since 2000. In 2015, 10 247 wells reported a SCVF or GM, totalling  $86 \text{ } 10^6 \text{ m}^3$  of natural gas emissions.

**Table 10. Emissions from SCVF and GM**

Year	Number of wells with SCVF, GM, or both <sup>a,b</sup>	Annual natural gas emission ( $10^6 \text{ m}^3$ ) <sup>c,d,e</sup>
2000	4 404	53
2001	4 557	55
2002	5 197	70
2003	5 663	84
2004	6 052	86
2005	6 479	94
2006	7 337	95
2007	7 880	100
2008	8 495	104
2009	8 762	98
2010	8 926	95
2011	9 318	92
2012	9 563	88
2013	9 624	89
2014	9 982	84
2015	10 247	86

a. The natural gas emissions are calculated for wells with SCVF, GM, or both, that have not been repaired.

b. There are wells that have SCVF flow rates that are too small to measure and GM where a flow rate cannot be determined. For these cases, a flow rate of  $1 \text{ m}^3/\text{day}$  was used.

- c. The flow rates reported are from a single point in time and are extrapolated to determine annual emissions. Flow rates for SCVF and GM can fluctuate significantly over a period of time and are usually not stable flow.
- d. Typically, the methane content of natural gas in SCVF and GM is between 95 and 99 per cent.
- e. SCVF or GM with no reported emission type are assumed to be natural gas and have a flow rate equal to the average of all other reported natural gas SCVFs.

The age, construction, and operation of the well affects the rates of SCVF and GM. As a result, the rates of SCVF and GM occurrence differ throughout the well life cycle. Table 11 shows the percentage of wells with SCVF or GM in 2015, both repaired and unrepairs, based on the well life cycle status. For all wells that were not abandoned, 6.8 per cent had a reported SCVF or GM.

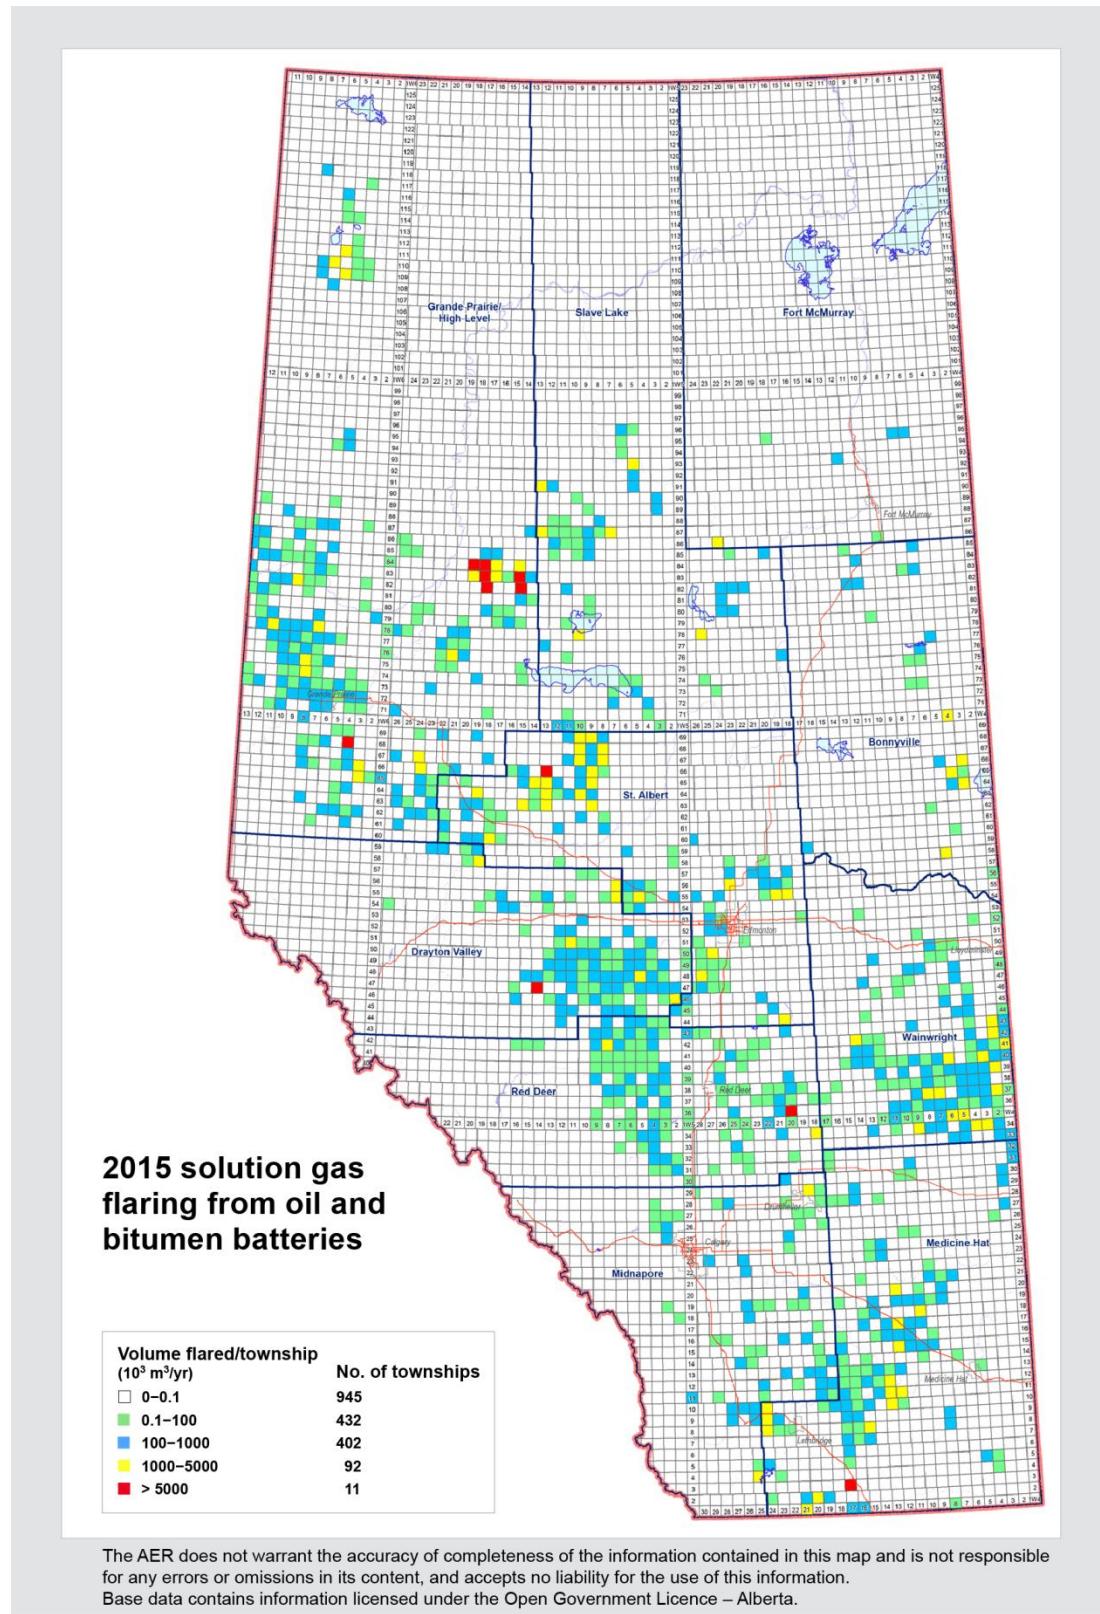

**Table 11. Percentage of wells with SCVF, GM, or both by well life cycle status in 2015**

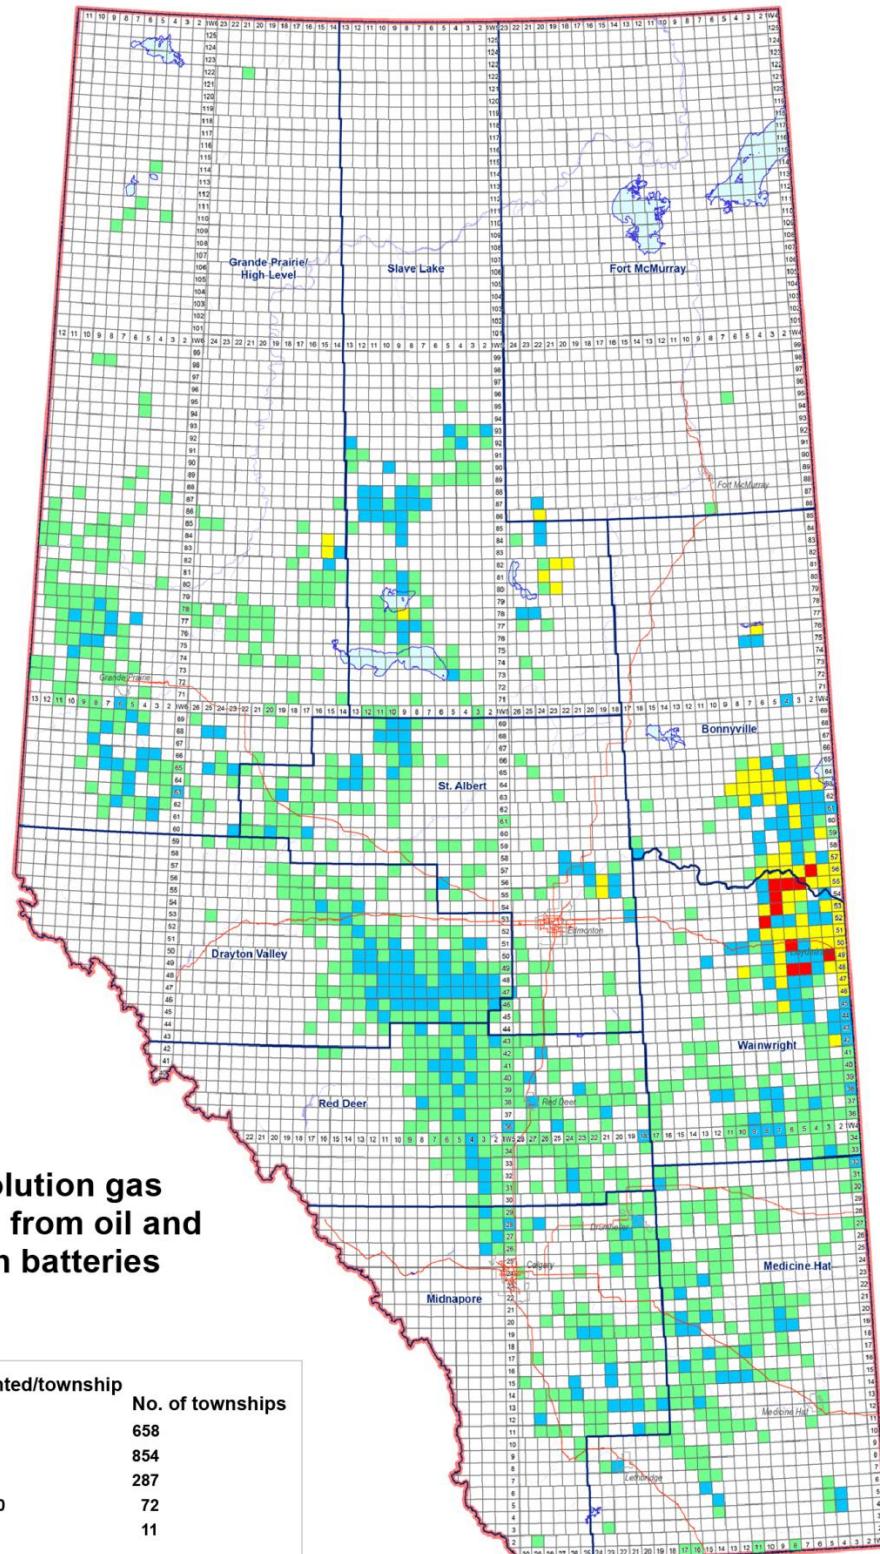

Well life cycle status	Number of wells	Number of wells that reported SCVF or GM	Percentage of wells with SCVF or GM (%)
New drills	1 420	34	2.4
Active	184 481	9 632	5.2
Inactive	82 985	8 525	10.3
<b>Total</b>	<b>268 886</b>	<b>18 191</b>	<b>6.8</b>

New drills are wells that have been recently drilled and for which licensees are required to test and report any SCVF or GM identified. Active wells are those that are currently producing or injecting and reporting volumetric activity on Petrinex. Inactive wells are those that have not reported any volumetric activity for either 6 or 12 months, based on the risk of the well as defined in *Directive 013: Suspension Requirements for Wells*. However, the number of inactive wells shown in the table also includes other wells that are not part of *Directive 013*, such as observation wells and training wells.

## 8 Provincial Solution Gas Flaring and Venting Maps

The following maps of the province depict solution gas flaring and venting by township.

The AER does not warrant the accuracy of completeness of the information contained in this map and is not responsible for any errors or omissions in its content, and accepts no liability for the use of this information.  
Base data contains information licensed under the Open Government Licence – Alberta.

## 9 Solution Gas Emissions Ranking of Operators for 2015

The AER has ranked companies based on volumes from operated crude oil and crude bitumen batteries of (1) solution gas production, (2) vented solution gas, and (3) flared plus vented solution gas. The tables in this section provide information on individual companies. The second column in the tables shows the percentage of solution gas conserved by an operator. The operator's performance can be compared with the provincial average of 96.4 per cent solution gas conservation.

In this analysis, all crude oil and crude bitumen batteries have been included except for batteries that had an experimental well reporting fluid production in a month. The information on experimental wells remains confidential. This is the reason for the variance between the numbers from the text of this report and the ranking tables in this section.

Note that it is possible for an operator to flare or vent a significant volume of solution gas due to the magnitude of the company's operations and still have a high percentage of gas conserved.

Companies are ranked province-wide and within each AER field centre area. The following describes the fields that appear in the ranking tables:

**Company:** Name of company operating crude oil and crude bitumen batteries.

**Gas cons:** Percentage of solution gas conserved.

**Gas cons change:** Percentage change in gas conservation from the previous year. Blanks represent companies that did not report in 2014 due to mergers, name changes, acquisitions, etc.

**Gas flared + vented (1000 m<sup>3</sup>):** Solution gas flared plus vented from operated crude oil and crude bitumen batteries.

**Gas flared + vented rank:** The company's ranking compared with other companies based on the operated volume of solution gas flared plus vented.

**Gas flared (1000 m<sup>3</sup>):** Solution gas flared from operated crude oil and crude bitumen batteries.

**Flare rank:** The company's ranking compared with other companies based on the volume of solution gas flared.

**Gas vented (1000 m<sup>3</sup>):** Solution gas vented from operated crude oil and crude bitumen batteries.

**Vent rank:** The company's ranking compared with other companies based on the volume of solution gas vented.

**Oil prod (m<sup>3</sup>):** Volume of crude oil and crude bitumen produced from operated crude oil and crude bitumen batteries.

**Sol'n gas prod (1000 m<sup>3</sup>):** Volume of solution gas produced from operated crude oil and crude bitumen batteries.

**Sol'n gas rank:** The company's ranking compared with other companies based on the volume of solution gas produced.

**GHG emissions (tCO2e):** The total GHG emissions based on flared and vented gas volumes.

**GHG emissions rank:** The company's ranking compared with other companies based on the GHG emissions.

In the tables that follow, the companies are ranked and listed based on solution gas flared plus vented from their operating facilities in 2015.

- Operators with the Largest Volumes of Produced Solution Gas in 2015
- Operators with the Largest Volumes of Vented Solution Gas in 2015
- Provincial Ranking of Operators—2015 Conservation Performance
- Field Centre Ranking of Operators—2015 Conservation Performance

**Operators with the Largest Solution Gas Produced Volumes in 2015<sup>1</sup>**
