1. Background

- Harvest holds 100% ownership of 15 sections in 76-7-W4M
  - located approximately 10 km southeast of Conklin
1. Background

- February 3, 2010 – Commercial Scheme Approval No. 11387 for BlackGold Phase 1 for 1,590 m³/d bitumen recovered with the SAGD process.
- September 1, 2010 – Amendment Approval No. 11387A transfer of BlackGold Oil Sands Lease from KNOC Canada to Harvest Operations Corp.
- GEO 110308 4D Acquisition plan was Approved
- January 30, 2012 – Amendment Approval No. 11387B confirming minor modifications to the plot plan and modification of well trajectories.
- March 7, 2012 – Amendment Approval No. 11387C confirming a minor modifications to CPF.
- September 26, 2013 – Amendment Approval No. 11387D Phase 2 Application to produce an additional 3,180 m³/d bitumen.
- April 22, 2014 – Amendment Approval No. 11387E – to reclassify well 1AA/06-12-077-06W4M
- September 26, 2014 – Amendment Approval No. 11387F – increasing the maximum bottom hole operating pressure of the pilot well pairs from 4,000 kPag to 5,500kPag during steam circulation.
- June 15, 2018 – Amendment Approval No. 11387G – increasing the maximum bottom hole operating pressure of the pilot well pairs from 4,000 kPag to 5,000kPag during SAGD operations.
- Dec 10, 2018 - GEO 180081 4D Acquisition plan was approved and GEO 110308 4D Acquisition plan was closed.

1.2 Geology / Geoscience – Pay Definition

**GROSS BITUMEN IN PLACE (GBIP)**

Petrophysical Criteria for bitumen pay:
- Resistivity (RT) $\geq 20$ ohm-m
- Porosity (DPSS) $\geq 27$

**SAGD-able BIP (SBIP)**

SBIP = continuous (>10m thick) GBIP

**Non-SAGD-able BIP (NSBIP)**

NSBIP = continuous (<10m thick) GBIP

**NOTE 1:**

10m continuous pay is defined from cores, images and well logs.

**NOTE 2:**

<1m thick shale commonly defines the top of the pay interval.

**EXAMPLE 1**

Pay Interval 1:

$204m - 198m = 6m$ (since $<10m$) $\rightarrow$ NSBIP

Pay Interval 2:

$239m - 208m = 21m$ (since $>10m$) $\rightarrow$ SBIP

Non-pay interval:

$208m - 204m = 4m$ (since $>1m$ separates pay)

**Gross Thickness:**

$239m - 198m = 41m$

**GBIP:**

$43m - 4m = 39m$
### 1.2 Geology / Geoscience – Pay Definition

**GROSS BITUMEN IN PLACE (GBIP)**

Petrophysical Criteria for bitumen pay:
- Resistivity (RT) $\geq 20$ ohm-m
- Porosity (DPSS) $\geq 27$

**SAGD-able BIP (SBIP)**

SBIP = continuous (>10m thick) GBIP

**Non-SAGD-able BIP (N-SBIP)**

N-SBIP = continuous (<10m thick) GBIP

**NOTE 1:**
10m continuous pay is defined from cores, images and well logs.

**NOTE 2:**
<1m thick shale commonly defines the top of the pay interval.

**EXAMPLE 2**

Pay Interval 1:
237m–197m = 40m ($\text{since } <10m$) $\rightarrow$ SBIP

Pay Interval 2: NA

Non-pay interval: NA

**Gross Thickness:** 237m – 197m = 40m

**GBIP:** 40m – 0m = 40m

BlackGold McMurray Reservoir Caprock-Wabiskaw Regional Marine Shale

Reference Well 1AA/02-12 (previous slide)

SAGD area, Sec 12

Wabiskaw Marine Shale Isopach
Harvest Blackgold Project
Contour interval = 0.5 m
(modified from July 2008)
1.2 Geology / Geoscience

- BlackGold seismic cross section

The Q-channel has been incised in Wabiskaw shale formation, BlackGold Oilsands Reservoir’s main caprock.
1.2 Geology / Geoscience

Quaternary Channel Incision – BlackGold Project Area

Summary
1) All wells within the Blackgold SAGD area display formation tops from the McMurray Formation to the top of the Clearwater Formation (no erosion). There is no evidence these formations have been compromised by Quaternary incision.

2) The majority of wells within the SAGD area display a well-defined Lower Grand Rapids top.

3) The Quaternary succession does incise into the top of the Lower Grand Rapids in 4 wells within SAGD area.

4) The Quaternary does not incise into the top of the Clearwater shale (Clearwater Formation) within any of the Harvest’s Blackgold oil sand leases.

5) There is a minimum thickness of 84 m between the top of the McMurray Formation and the top of the Clearwater Formation.

Deformation changes recorded over BlackGold Pilot SAGD drainage pads are within typical values for SAGD projects.
BlackGold geomechanical data and analyses
- Mini-fracture physical testing results obtained in 2008.
- The in-situ minimum stress in the McMurray shale is between 6.01 MPa and 6.9 MPa (16.7 to 19.2 kPa/m).
- BlackGold geomechanical modeling confirmed that the McMurray cap rock integrity has a maximum down hole pressure of 6 MPa.
- Approved maximum operating pressure is 5.5 MPa during steam circulation and 5 MPa during SAGD operations.
1.3 Drilling and Completions

- Well pair trajectories.

**Legend**
- Well Pair Trajectory
- 3D Seismic (23 km²)
- Drilled before 2006 (52 wells)
- Drilled 2007 (19 wells)
- Drilled 2008 (32 wells)
- Drilled 2009 (30 wells)
All BlackGold SAGD well pairs are spaced about 95 - 100 meters except for 102-4, 102-5 and 102-6 which are spaced about 85 - 90 meters.
1.3 Drilling and Completions

Overview of OBS Wells

- Harvest drilled 12 observation wells in 2011 to monitor performance
  - 4 clamp type wells installed thermocouples and pressure gauge
  - 8 spool in type wells installed thermocouples
1.3 Drilling and Completions

- Typical well bore schematic – Injector

**Harvest BlackGold Injector Completion Schematic**
- Both Stages (Warm-Up and SAGD)
- Surface casing: 16”OD
- Intermediate casing: 11 3/4”OD
- Slotted liner: 8 5/8”OD
- Long string: 3 1/2”OD Near Flush Jt swedged down to 2 7/8” Flush Jt from ICP to end of Short String, then 3 1/2” OD Near Flush Jt to toe
- Short string: 4 1/2” OD Near Flush Jt swedged down to 3 1/2” Near Flush Jt from ICP and stung in 50-150m into Liner
- Permanent Guide String: 1.6”OD IJ Flush Jt (instrumentation housed inside)

Note: All tubing dimensions are shown as max OD, and casing ID dimensions are drift
1.3 Drilling and Completions

- Typical well bore schematic – Producer during circulation

Harvest BlackGold Producer Completion Schematic
- Circulation (Warm-up) Stage
- with 9 5/8" Intermediate Casing

- Surface casing: 13 3/8" OD
- Intermediate casing: 9 5/8" OD to ICP
- Slotted Liner: 7" OD
- Long string: 2 7/8" OD Near Flush Jt for 1 or 2 joints at surface swedged up to 3 1/2" OD Near Flush Jt to toe
- Short string: 4" OD Flush Jt to ICP
- Permanent Guide String: 1.6" OD IJ Flush Jt (Instrumentation housed inside)

Note: All tubing dimensions are shown as max OD, and casing ID dimensions are drift.
1.3 Drilling and Completions

- Typical well bore schematic – Producer on SAGD production with ESP (Electric Submersible Pump)

Harvest BlackGold Producer Completion Schematic
- SAGD Production Stage

- Surface casing: 13 3/8” OD
- Intermediate casing: 9 5/8” OD to ICP
- Slotted liner: 7” OD

- Permanent Guide String: 1.6” OD IJ Flush Jt (instrumentation housed inside)
- Short string -3 1/2” OD near flush joint (SLXP) with ESP

Note: All tubing dimensions are shown as max OD, and casing ID dimensions are drift.
1.3 Drilling and Completions

- Harvest installed a Flush Absolute Cartridge System (FacsRite) for sand control in 15 producers:
  - Sand retention and retained permeability properties.
  - Tolerates wider variation in Particle Size Distribution (PSD).
  - Higher Open Flow Area (OFA) than gap-based media.
  - Premium media discs flush mounted and tightly secured into the base material.
  - 316 SS, 25.4mm disc with OFA of 3.61% at 22 discs/ft.
1.4 Artificial Lift

Start-Up Strategy

- Steam circulation was initiated on all well pairs June 19-21, 2018.
- The first ESP installation commenced on August 25, 2018 after 62 days of circulation.
- Rigorous conversion criteria were used to establish ‘readiness’ for ESP installation/conversion to SAGD.
- High Temperature ESP’s were installed on all 10 well pairs after 62-96 days of circulation. Short circulation times are attributed to increased circulation pressures (5,400 kPa) and well separation (4 meters at the toe, 5 meters in the middle, and 6 meters near the heel).
- Production ramp-up has been constrained by market pricing conditions: however, production performance has exceeded expectations.
1.4 Artificial Lift

- 12 well pairs have been started with 10 converted to ESP September 1-October 5, 2018. The remaining 2 well pairs are operating using steam lift, to assess well pair production potential.
- All ESPs have bubble tubes at the heel for pressure measurement. Bubble tubes present in the IJ strings are also used when functional. The ESP systems leverage the existing DTS to monitor intake temperature.
- ½” Heel bubble tubes are installed with the ESPs at the heel to monitor intake pressure
- All original ESP systems are still operating.
- ESP total fluid production capacity will vary between 300 to 730 m³/day.

1.7 Scheme Performance

Scheme Performance Highlights:

- First steam in June 2018.
- First well pair on full SAGD occurred in September 2018.
- First Oil Production September 3, 2018.
- CPF exceeded uptime expectations resulting in faster time to conversion and less thermal cycles on the wells and equipment.
- Ramp rates and performance exceeding expectations.
- Project peak rate is expected during Q4 2019.
1.7 Scheme Performance

Performance Prediction Methodology

- Simulation and Butler analytical models used to predict SAGD performance.
- SAGD analogues used to tune peak rates, ramp-up time, and SOR.

1.7 Scheme Performance

Excellent Performing Well pair Example: (102P08: Pilot East Area)
1.7 Scheme Performance

Observation Well Monitoring:

- Observation Well 7, 1.2m South from 102P10 between heel & middle
- Steam chamber development, 5m in height 5 months after first steam.
- Temp and Press from Nov 30, 2018
- Pressures recorded at 201.8mSS, showing 6554 kPa are erroneous, piezometer failed.
  - Max injection pressure did not exceed 5000kPa, as alarm system in place to ensure pressure does not exceed 5000kPa.
  - Temperatures of 253°C recorded at same depth, reflect saturation pressure of ~4200kPa
1.7 Scheme Performance

Lessons Learned:

 SAGD Start-up Learning:
1. Higher pressure led to reduced circulation time.
2. Fiber temperature was used with 100% success rate to accelerate time to SAGD conversion (with earliest conversion at 62 days).
3. Difficulty killing wells due to reservoir retaining higher pressure for longer than expected, required heavier kill fluid and longer shut-in duration prior to rig operations.
4. Low facility downtime led to shortened circulation times (62-92 days).
5. Production chokes not specifically designed for solids erosion resulted in valve failures and required implantation of special monitoring and alarms, and alternate valve design.
6. By leveraging full fiber executed controlled heating on initial well warm ups.

 ESP Learning:
1. Initial ESP designed to accommodate peak production rates were to accommodate turndown of start-up without any early equipment failures and will be future design criteria.
2. No additional temperature measurement installed with ESPs as existing fiber has been successful for intake temperature monitoring-bubble tube installed with the ESP is used for downhole pressure monitoring.

2.1 Facilities

2018 Facilities Overview

Plant Construction and Commissioning
- Construction resumed in Q1 2018 to allow operations to begin in Q2 2018.
- Main modifications were the addition of bypasses, control valves, and the final completion of other piping and equipment that were not installed during the original construction.
- Final construction of the facility was completed by Q3 2018.

Plant Performance
- Commissioning of the facility was started in Q2 2018 with final commissioning of the last major unit operations in Q4 2018.
- First Steam to wells was in June 2018.
- 12 of 15 well pairs were started over the two well pads with 10 of 12 then converted to ESP production.
- As of Q4 2018, production peaked to over 1,113 m³/day of bitumen.
- Most equipment is achieving high reliability in the early stages with the ramp up exceeding expectations.
2.1 Facilities

Plant and Well pad Operational Issues and Activities

- **Successes**:
  - Ramp up of Bitumen Production
  - High Reliability of Equipment (99%+)
  - Inlet Separation Consistency
  - Water Treatment and Reuse Commissioning and Operation
  - Diluent Recovery System Commissioning and Operation (> 98% recovery of diluent)

- **Challenges**:
  - Well pad 102 Choke Valve erosion
  - Vapor Recovery Unit (VRU) solids buildup and flaring
  - Trucking logistics

2.2 MARP

2018 MARP Overview

- The updated MARP was submitted and approved in 2017 in accordance with AER Directive 042 requirements.
- MARP has been continually reviewed during the startup process to ensure that the meters are performing as expected.
- During the ramp up of the plant in the last 6 months, proration factors and proper water cuts via the AGAR analyzers at the pads and manual samples have been worked on continually to ensure they are as accurate as possible.
- MARP meter temperature and pressure compensation has also been continuously improved for regulatory volume totalizing including the water balance.

Compliance with regulations
- Meters will be calibrated as per the requirements within Directive 017.

Solvent and gas injection
- No immediate plans to use solvent.
Even early in the BlackGold project, water and oil proration factors are within AER guidelines.
Production Sampling

- AGAR’s with sampling stations are in place.
- Significant bitumen volumes (oil cuts >10%) were not anticipated until after circulation, allowing time to calibrate meters. Meters have been calibrated twice. Calibration is supported by grab sample cuts.
- Single meter for multiple well pairs will help meter calibration. Only 2 AGARs will make oil cut measurement consistency easier.
- Chlorides are being used to monitor performance/optimize steam/validate cuts.
2.2 MARP

2018 MARP Overview

- Well production and injection volumes are estimated by the use of Coriolis meters (emulsion) and vortex meters (injection) for each well as the raw data check for the well tests.

- BlackGold utilizes one test separator per pad that automatically cycles through each well on the pad. Well test duration can be altered. Pad 102 wells (8 wells) are tested at 2 per day, 4 days between well tests. Pad 101 wells (4 wells) are tested at 2 per day, 2 days between well tests.

- Typically each well will be in test for 85 hours per month. Test separators are used continuously.

- Well testing validations are completed once per week per pad within the Energy Components software by the engineering team.

- This data is rolled up and balanced with the facility production and injection volumes to determine month end pro-rations prior to submission to Petrinex.

2.3 Water Sources and Uses

Fresh Water Well
- Well test was previously completed and estimated to generate approximately 600 m$^3$/d.
- LSD: 07-14-076-07W4/ ABWS 0149324: TDL: 00413718

List of Brackish Water Wells Completed in the Clearwater B Formation
- 1F1/01-11-076-07W4/0 (Main Source well 802A)
- 1F1/07-11-076-07W4/0 (Main Source well 801A)
- 100/01-11-076-07W4/0 (Backup Well 802B)
- 100/07-11-076-07W4/0 (Backup Well 801B)

Volume of Saline Water
- The volume of brackish/saline water required for steaming operations is about 608 m$^3$/d for normal operation.

Saline Source Water Well Production Test commenced (Oct 2016)
- The total volume of water produced was measured by flow meter installed in the well common header (801-FIT-0104 and 802-FIT-0104) and in CPF (80-FIT-0163) including flow totalizers.
- Separate casing vent gas measurements were executed between June, 2018 and October, 2018 to establish brackish source well gas rates. (GLR)
Fresh water inventories were utilized for commissioning and startup.
2.3 Water Sources and Uses

- **1-11-76-7W4M & 7-11-76-7W4M**
  - Depth: 350 m to 353 m Total Vertical Depth (TVD)
  - Primary wells for source water

- **07-14-76-7W4M – Surface Location**
  - Depth: 109.7-115.8 TVD
  - Back-up for source water
  - ABWS 0149324

- **7-11-76-7W4M**
  - Formation: Clearwater B
  - TDS: 4,330 ppm

- **1-11-76-7W4M**
  - Formation: Clearwater B
  - TDS: 4,550 ppm

- **Well ID No. 1421226**
  - 07-14-76-7W4M
  - Formation: Undifferentiated Q Sediments
  - TDS: <4,000 ppm
2.3 Water Sources and Uses – Casing Gas

- Casing gas vented to atmosphere-rate measurement by 3rd party
- 3rd party testing completed October, 2018.
- Wells are being operated to maintain gas vent rates below 500 m³/day per well

2.4 Water Treatment Technology

- The water treatment technology is a high pH Mechanical Vapour Compression (MVC) evaporator with a crystallizer and solid forming equipment.

**Evaporator Process**

- The feed water enters the steam stripping de-aerator, which has five stages of separation that lowers the dissolved oxygen level to less than 7 parts per billion.
- The split-summ design minimizes energy consumption by evaporating roughly 70% of the total distillate flow in the first stage, or split.
- The remaining 30% of the total distillate flow is produced in the second split under slightly more rigorous operating conditions. Combined distillate from two splits flows through a common distillate collection line.
2.4 Water Treatment Technology

Crystallizer Process

- The liquid waste, or blow-down, from the Evaporator unit is collected in an agitated Crystallizer feed tank.

- The brine is heated a few degrees as it passes through the heater and flashes when it re-enters the vapour body.

- The vapour produced is collected in the vapour body, passes upward through an entrainment separator, and enters the suction side of the rotary lobe type vapour compressor. The vapour is transferred to the shell side of the heater where the vapour condenses, providing the thermal driving force for evaporation. The condensed vapour is collected in the condensate tank and transferred to the evaporator feed tank.

- To control the recirculation brine solids level, a slipstream is removed from the crystallizer recirculating brine and sent to the Crystallizer Waste Tank where it is continually mixed and recirculated to maintain suspension of the solids.
2.4 Water Treatment Technology - Performance

- Performance of the industrial waste water treatment plant has been as expected.
- The Directive 081 Disposal Limit calculated for the facility is 15.6% with the facility Actual Disposal of 0.93%.
- The Directive 081 Produced Water Recycle for the facility was 98.6%.
- Brackish Water is the predominant make-up source for steam generation.
- Fresh Water inventory was utilized for commissioning and start-up of the steam generator.
- Fresh Water was licenced as make-up under a Temporary Diversion Licence (TDL).
- An additional TDL for surface water was sourced for dust suppression from a Borrow Pit located on SML 090073 located north of the CPF.

2.5 Water and Waste Disposal

- There are no disposal wells or landfills associated with the BlackGold Project.
- All waste streams are transported offsite within Alberta to AER approved third party waste management facilities.
- Waste water streams include crystallizer waste, evaporator waste, produced water in slop oil, and any wash water collected in the facility.
- Slop oil was transported to AER approved waste management facilities for recovery.
- Third party waste receivers include Tervita, White Swan Environmental Ltd., Secure Energy Services and CNRL.
- The BlackGold Project is designed to utilize a proprietary cement plant process as part of its industrial waste water management system.
- To date commissioning of the cement plant has not been successful and Harvest will re-evaluate the need for commissioning the cement plant in the later half of 2019.
- Solid waste and waste fluids (i.e. sewage, sludge, etc.) produced at the facility trucked out to third party disposal facilities.

2.4 Water Treatment Technology
2.5 Water and Waste Disposal
2.6 Sulphur Production
2.7 Environmental Issues & Compliance
2.8 Surface – Future Plans
2.6 Sulphur Production – Emissions

- Peak SO₂ Emissions were 0.15 tonnes on October 25 during a VRU outage.
- Average SO₂ Emissions During Q3 were 0.0018 tonnes/day.
- Plant Total SO₂ = Flared SO₂ + SO₂ Steam Generator.
- The Glycol Heater is supplied by purchased sweet fuel gas.
- Steam circulation of well pairs commenced in June of 2018.
- ESP conversion commenced in late August and was finalized in October.
- It is expected SO₂ emissions will increase as production ramps up to nameplate rates.
- SO₂ production is well below the EPEA Approval emission limits of 0.75 tonnes/day.
- Sulphur production is well below the 1 tonne/day limit.
- Harvest will continue to monitor monthly produced gas H₂S concentrations and sulphur emissions.

Harvest has not identified any compliance issues with regards to regulatory approval conditions related to the development of the BlackGold Project.
2.7 Applications

- Temporary Diversion Licence from existing fresh water well completed into the Undifferentiated Quaternary Sediments was authorized on May 1, 2018 as an alternate make-up supply to the saline source.
- Temporary Diversion Licence to utilize surface water for dust suppression on roads undergoing maintenance and upgrades, May 24, 2018.
- OSCA Approval 11387G received June 15, 2018 for increase of maximum operating pressure for thermal well pairs to 5MPa during SAGD Operation.
- D56 Facility Licence Amendment authorized to update the approved electrical compression capacity at the central processing facility.
- Oil Sands Exploration Program OSE180046 – Authorized on November 23, 2018.
2.7 Environmental Monitoring

- Harvest commenced operational monitoring in 2018
- Wetland and Waterbody Monitoring Program
  - Installation of monitoring plots and wells for wetland monitoring.
  - First year of monitoring complete, program progress was updated with the AER in December.
- Wildlife and Caribou Mitigation and Monitoring Programs
  - Camera monitoring program on above ground pipeline crossings.
  - Employee wildlife card program.
  - Comprehensive Wildlife Report was submitted in September 2018 and SIRs responded to in December.
  - CPP (Caribou Protection Plan)
- Soil Monitoring Program Proposal
  - Authorized in January 2018.
  - Baseline monitoring program executed in April 2018 prior to commencement of operation.
  - No significant impacts were identified.
  - Soil management program not required.
- Ground Water Monitoring Program
  - Program includes near surface and thermal effects monitoring wells.
  - Additional near surface monitoring wells were installed in April.
  - Semi-annual groundwater monitoring events occurred.
2.7 Environmental Monitoring continued

- **Air Emissions Monitoring**
  - Monthly passive air monitoring around the facility for SO\textsubscript{2} and H\textsubscript{2}S indicated compliance with the AAAQG’s.
  - Continuous emissions Trailer Monitoring was completed prior to commencement of operation from December 2017 to the end of February 2018 with results indicating compliance with the AAAQG’s.
  - Continuous emissions trailer monitoring during operations results indicate compliance with the AAAQG’s.
  - Manual stack testing was completed for the Glycol Heater and the Steam Generator and results indicate compliance with the NO\textsubscript{x} requirements of Table 3.1 of the EPEA Approval.

- **Continuous Emissions Monitoring Program (CEMS)**
  - One CEMS package is located on the steam generator exhaust stack for measurement of NOx.
  - Stack sampling ports were modified to be compliant with the Alberta CEMS Code and Alberta Air Monitoring Directive prior to commissioning of the steam generator exhaust stack.
  - AER authorization received to not utilize unreliable CEMS data in June and early July.
  - CEMS component reliability and uptime has been steadily improving as issues are identified and resolved.
  - CEMS certification was postponed in November 2018 due to maintenance issues with the Wet O\textsubscript{2} Analyzer.
  - A variance was requested from and granted by the AER to extend the certification period for the CEMS unit.
  - All data was reported as pre-certification data.

- **Surface Water Monitoring**
  - Industrial runoff monitored and tested prior to release and reported annually.
  - Industrial runoff parameters meet the limits established in Table 1 of the EPEA Approval.
  - Water use reporting for dust control and for steam generation for Temporary Diversion Licences.
- Harvest tracks all non-reportable spill events within the corporate incident tracking system.
- All incidents are reviewed internally to identify casual factors and to ensure that corrective actions are taken.

The Reclamation Monitoring Program was submitted on January 15, 2018 and authorized on May 9, 2018.

The Project Level Conservation and Reclamation Program was submitted on October 30, 2017 and authorized on July 3, 2018.

Since the BlackGold Project commenced operations in 2018 as per the PLCRCP reclamation of project development areas is not planned for the next 5 years.

Harvest is compliant with the Alberta Oil Sands Monitoring Program.

Participation in the Alberta Biodiversity Monitoring Institute’s 2017 monitoring program.

Harvest is a member of the Explorers and Producers Association of Canada.
2.8 Surface – Future Plans

- BlackGold completion key dates and timelines:
  - December 2017, construction resumes.
  - Q2 2018, first steam generated.
  - Q3 2018, Electric Submersible Pump (ESP) installations completed.
- NG Co-injection application in 2019.
- Debottleneck the existing facility in 2019.
